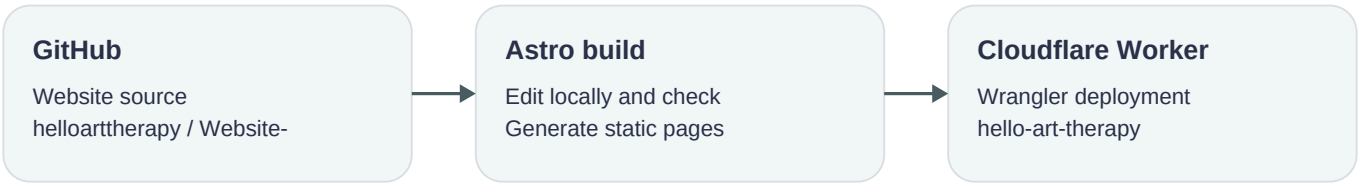
How the site works

A practical record of the live Astro website, platforms and update process.

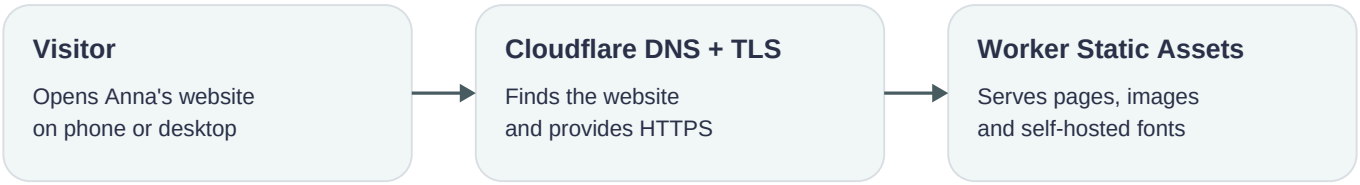
Live site: www.annaworthingtonarttherapy.com
Project: Hello Art Therapy / H Art. Owner account: anna@helloarttherapy.com.

01 PUBLISH THE WEBSITE



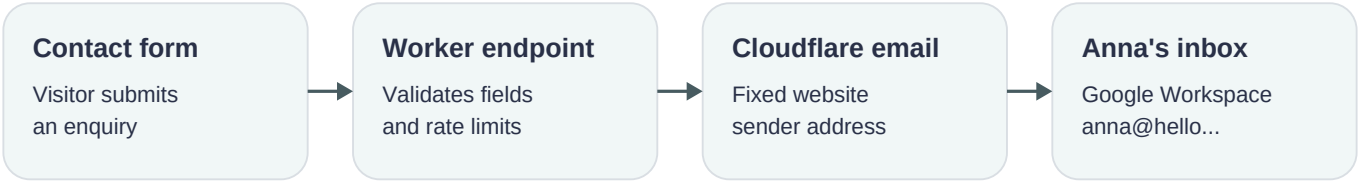
Publishing is manual. GitHub Actions checks changes; it does not deploy.

02 VISIT THE WEBSITE



GoDaddy holds the domain registration; its nameservers point to Cloudflare.

03 SEND A CONTACT MESSAGE



Website files are served by Cloudflare. Contact messages are emailed directly to **anna@helloarttherapy.com**. The website does not store enquiry contents in a database.

Squarespace supplied the original content and artwork. Its account and billing remain separate from the new live hosting.

Platforms and connections

Where each part lives and what it is responsible for.

Platform	Role in this setup
GoDaddy	Registers and renews **annaworthingtonarttherapy.com**. Nameservers delegate DNS to Cloudflare.
Cloudflare	Authoritative DNS, HTTPS certificates, redirects, Worker hosting, static assets and contact email delivery. Account: **anna@helloarttherapy.com**.
GitHub	Source repository: helloarttherapy/Website-. Main branch: **main**. GitHub Actions runs checks, a build and tests.
Astro + Node.js	Astro creates the static website. Use **Node.js 22** for maintenance. Images and Belleza / Tenor Sans fonts are bundled locally.
Google Workspace / Gmail	Receives contact enquiries at **anna@helloarttherapy.com**. The separate mail domain **helloarttherapy.com** keeps its existing Google mail setup.
Amazon	External purchase destination for **Art for the Everyday**. amazon.com.au/dp/B0HMHYSVPV
Spotify + other socials	External links from the footer. Spotify points to the Words, Pictures and Things show.
Squarespace	Previous website platform. Public content was migrated; the old account and billing have not been cancelled.

Domain and hosting details

Cloudflare nameservers
andronicus.ns.cloudflare.com
chelsea.ns.cloudflare.com

Worker: hello-art-therapy
Preview: hello-art-therapy.hello-art-therapy.workers.dev

Both root and www are connected as Worker custom domains. HTTP redirects to HTTPS. The root domain permanently redirects to www, retaining page paths and query strings.

Editing and publishing

Use this process whenever website copy, layout, links or artwork changes.

1. Edit the website files

Local project folder:
`/Users/administrator/Documents/ChatGPT/H Art`

What to update	File or folder
Migrated copy and articles	src/data/site.json
Page layouts, contact copy and book	src/pages/
Navigation and footer links	src/components/Header.astro src/components/Footer.astro
Colours, buttons and spacing	src/styles/global.css
Images and legacy redirects	public/images/ and public/_redirects
Search metadata	src/lib/seo.mjs and astro.config.mjs
Contact delivery / hosting	worker/index.mjs and wrangler.jsonc

2. Preview and verify

For a fresh checkout, install dependencies with `npm ci`. Start a local preview while editing with `npm run dev`. Before publishing, run:

```
npm run check
npm run build
npm test
```

The migration tests read the built **dist** folder, so build before running them. Check the changed pages on desktop and mobile, along with navigation and links.

3. Save to GitHub, then publish

Review the diff, commit the intended changes and push to **main**. GitHub Actions runs validation. Publish from the intended checkout using:

```
npm run deploy
```

This builds the site and deploys with Wrangler profile **hello-art-therapy** to Anna's pinned Cloudflare account. A GitHub push alone does not publish the site.

4. Check the live result

Open the live website and verify the changed pages. For contact changes, submit a clearly labelled test and confirm it reaches Anna's inbox. Keep credentials out of source files and Git.

Site flow and upkeep

The main visitor routes, email configuration and recovery references.

Visitor flow

Homepage introduces art therapy, benefits, Anna's offer and testimonials. The original main navigation leads to the following pages:

Page	Live path
What is Art Therapy?	/new-page
How it works	/how-it-works
About	/about-1
Blog and individual articles	/blog and the preserved dated article URLs
Contact	/contact
Art for the Everyday	/art-for-the-everyday Linked from the footer; Buy on Amazon opens Amazon.

Contact email setup

Endpoint: POST /api/contact
From: website@annaworthingtonarttherapy.com
To: anna@helloarttherapy.com
Reply-To: the visitor's email address
Confirmation: Thank you for message, I will be in touch shortly.

Cloudflare Email Routing is enabled on the website domain with MX, SPF and DKIM records. Anna's inbox is a verified destination. Validation, a honeypot and a limit of 5 requests per 60 seconds help filter unwanted submissions. The form shows success only after email-provider acceptance.

Troubleshooting and recovery

A recent edit is missing: confirm the correct checkout was built and deployed; saving or pushing code is not enough.
A contact message fails: check Cloudflare's EMAIL binding and verified destination, then use the direct email link while delivery is repaired.
Restore a previous version: use Cloudflare's Worker deployment history, or rebuild and deploy a known Git commit.

DNS backup: migration/godaddy-dns-before-cloudflare.json
Technical reference: README.md and wrangler.jsonc in the GitHub repository.

Launch verification covered all 102 sitemap pages, canonical links, descriptions, fonts, redirects and the 404 response. Contact email delivery was confirmed in Anna's inbox. Search Console submission remains a separate follow-up.
